

Abstract

A security safe having a housing defining a security enclosure, the housing including an opening into an interior of said enclosure for placing items into, and removing items from, said enclosure. A door mechanism is mounted to the housing for movement between opened and closed positions in relation to said opening, wherein in the closed position the door mechanism precludes access to said interior through said opening. In one version, the housing further includes an aperture for inserting items into said enclosure without moving said door mechanism into the opened position. In another version the aperture is defined in a door of the safe.
